f : sequence of records
(iterator)

Stream
Item for $\square \rightarrow \square \rightarrow \square \rightarrow \square \rightarrow \square \rightarrow \square$

Stream
of records $\square \text{ record} \quad \square \text{ record} \quad \square \text{ record} \quad \dots$

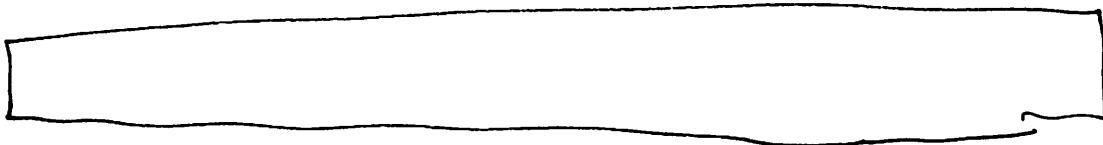

Stream
of bytes $\square \text{ byte} \quad \square \text{ byte} \quad \square \text{ byte} \quad \dots \square \text{ byte}$

pages
 $\square \quad \square \quad \square \quad \dots \quad \square$

Idea 1 store fields in a native format

pro: No casting

con: Need to save information about storage format

4	8	6	4
int	big string	big string	int

Fixed size encoding

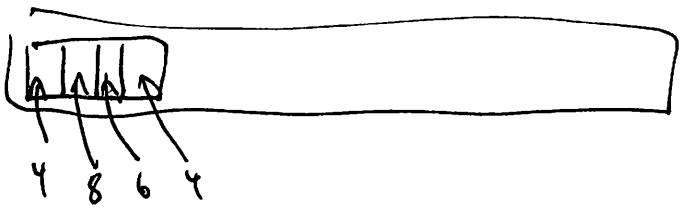

pro: No delimiters (saves 4 bytes)

con: Need to know max length

Wasted space on variable length fields

Not good for adding data

representing records
"CSV" → delimiters

"Fixed Width"

"Per record directory"

Factors

Size of the file

Types of the fields

How much data is changing

output

CSV

transform

filter records

read file
